

Please be sure you listen to all the hard evidence before allowing BPL free reign. Power companies have poor track records in policing their systems with regard to generating radio interference either because they lack the expertise or it is not profitable for them to concern themselves with a "secondary" effect. BPL intentionally places rf energy on power lines which are essentially very long wires in the sky or antennas! Can we expect the power industry to adequately control rf intentionally placed on power lines when they can't (or won't) control rf energy unintentionally generated by leaky insulators and old equipment?
